Powerful Print Management and Tracking System

Print Audit 5

Powerful Print Management and Tracking System

Companies large and small are constantly seeking ways to reduce overheads – premises, staffing levels etc. The one area that seems to be constantly overlooked, despite a massive impact on profitability, is precisely how much routine office copying and printing costs! Every draft, fax, memo, letter or document produced consumes paper, ink, toner and power.

Do you know just how many documents you produce in a week – a month or a year?

Do you know how many are in black & white and how many in colour?

Print Audit 5 provides the essential first step in proving to you how you could save money and reduce your printing costs by finding out:

- How much you are printing
- Where it's being printed
- How the print might be accomplished more effectively by understanding your print output and managing it more efficiently

Print Audit 5 is an extremely powerful but simple to install and configure tool that comprises of three components:

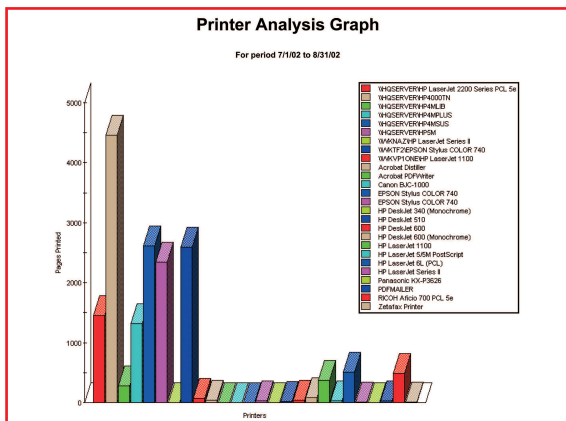

Analysis, Reduction and Recovery. These components are available individually or as a complete package suite.

Analysis

Most companies underestimate their print costs by as much as 50%

Print Audit 5 analysis provides an exact picture of current print volumes and cost - learn who is printing what and where through a series of volume analysis reports.

- Track print usage discreetly in the background
- Install silently on tens, hundreds or thousands of workstations without any user being aware of the exercise
- Track printer ports, colour information, number of pages and number of copies. It will also automatically distinguish between colour and mono output
- Identify equipment inefficiencies and suggest the most cost efficient print option in your organisation, or perhaps suggest replacement with more efficient and cheaper to run devices

Reduction

Without a print management solution, most companies could find their print costs are running out of control. Typically, document production expenses can be your third highest cost after payroll and premises.

Print Audit 5 can help control those costs:

- Redirect current workload to the most efficient devices and reduce waste and misuse
- Implement print limits for any given user with customisable pop-up messages or bar print by user, device type or colour
- Enforce automatic duplex printing and control colour printing

There's even a facility that allows you to notify a user of the print job cost before they print to a particular device and suggest lower cost options. That rationale may steer you towards the use of network connected Multifunctional Devices (MFDs) from Toshiba's e-STUDIO range, especially if colour output is required in your office.

Recovery

Controlling or tracking document production costs is even more vital for organisations that produce chargeable or billable documents. If you are still trying to track and bill for printing or plotting manually, you could be missing out on as much as 80% of your genuine recoverable income.

Print Audit 5 features:

- Optional job code validation and PIN codes with declining balances for chargeable jobs
- It integrates with accounting systems and is designed to work with major CAD packages on the market. Automate every step of the recharging process and never miss or underestimate another billable document ever again

This is a convenient and ingenious tool that allows you to audit, troubleshoot and collect meter reads via a small USB key. No software or hardware installation is required and a powerful reporting tool allows you to assign a cost per page and generate comparison reports between current and previous scans. The Rapid Assessment Key consists of four device management tools:

- Auditor enables the collection of network device information such as IP address, colour/mono breakdown, toner levels and serial numbers etc
- Analyzer discovers which network IP addresses are used and which are available
- Asset Tracker manages the fleet by writing inventory information to each device including name, department, serial number and asset number
- Remote Resetter allows you to remotely re-start one or more devices by importing their IP addresses. You can clear print jobs and restore device functionality in minutes for a simple quick fix.
